21 ***2 ebXML Technical Architecture Participants***

22

23 We would like to recognize the following for their significant participation in the
24 development of this document.

25

26 Team Lead: Anders Grangard, EDI France

27

28 Editors: Brian Eisenberg, DataChannel
29 Duane Nickull, XML Global Technologies

30

31

32 Participants: Colin Barham, TIE
33 Al Boseman, ATPCO
34 Christian Barret, GIP-MDS
35 Dick Brooks, Group 8760
36 Cory Casanave, DataAccess Technologies
37 Robert Cunningham, Military Traffic Management Command, US Army
38 Christopher Ferris, Sun Microsystems
39 Peter Kacandes, Sun Microsystems
40 Kris Ketels, SWIFT

41	
42	Piming Kuo, Worldspan
43	Kyu-Chul Lee, Chungnam National University
44	Henry Lowe, OMG
45	Matt MacKenzie, XML Global Technologies
46	Melanie McCarthy, General Motors
47	Stefano Pagliani, Sun Microsystems
48	Bruce Peat, eProcessSolutions
49	John Petit, KPMG Consulting
50	Mark Heller, MITRE
51	Scott Hinkelman, IBM
52	Karsten Riemer, Sun Microsystems
53	Lynne Rosenthal, NIST
54	Nikola Stojanovic, Encoda Systems, Inc.
55	Jeff Sutor, Sun Microsystems
56	David RR Webber, XML Global Technologies
57	

57 **3 Introduction**

58

59 **3.1 Summary of Contents of Document**

60 The keywords MUST, MUST NOT, REQUIRED, SHALL, SHALL NOT, SHOULD,
61 SHOULD NOT, RECOMMENDED, MAY, and OPTIONAL, when they appear in this
62 document, are to be interpreted as described in RFC 2119 [Bra97].

63

64 The following conventions are used throughout this document:

- 65 • *Capitalized Italics* words are defined in the ebXML Glossary.
- 66 • [NOTES: are used to further clarify the discussion or to offer additional
- 67 suggestions and/or resources]

68

136 **3.2 Audience and Scope**

137

138 This document is intended primarily for the *ebXML Project Teams* to help guide their

139 work. Secondary audiences include, but are not limited to: software implementers,

140 international standards bodies, and other industry organizations.

141

142 This document describes the underlying architecture for ebXML. It provides a high level

143 overview of ebXML and describes the relationships, interactions, and basic functionality

144 of ebXML. It SHOULD be used as a roadmap to learn: (1) what ebXML is, (2) what

145 problems ebXML solves, and (3) core ebXML functionality and architecture.

146

147 **3.3 Related Documents**

148

149 As mentioned above, other documents provide detailed definitions of the components of
150 ebXML and of their inter-relationship. They include ebXML specifications on the
151 following topics:

152

- 153 1. Requirements
- 154 2. Business Process and Information Meta Model
- 155 3. Core Components
- 156 4. Registry and Repository
- 157 5. Trading Partner Information
- 158 6. Messaging Services

159

160 These specifications are available for download at <http://www.ebxml.org>

161

162 **3.4 Normative References**

163

164 The following standards contain provisions that, through reference in this text, constitute
165 provisions of this specification. At the time of publication, the editions indicated below
166 were valid. All standards are subject to revision, and parties to agreements based on this
167 specification are encouraged to investigate the possibility of applying the most recent
168 editions of the standards indicated below.

169

- 170 ISO/IEC 14662: Open-edi Reference Model
- 171 ISO 11179/3 Metadata Repository
- 172 ISO 10646: Character Encoding
- 173 ISO 8601:2000 Date/Time/Number Data typing
- 174 RFC 2119: Keywords for use in RFC's to Indicate Requirement Levels
- 175 W3C XML v1.0 Second Edition Specification
- 176 UN/CEFACT Modeling Methodology (UMM)

177 **4 Design Objectives**

178

179 **4.1 Problem Description & Goals for ebXML**

180

181 For over 25 years *Electronic Data Interchange (EDI)* has given companies the prospect
182 of eliminating paper documents, reducing costs, and improving efficiency by exchanging
183 business information in electronic form. Ideally, companies of all sizes could conduct
184 *eBusiness* in a completely ad hoc fashion, without prior agreement of any kind. But this
185 vision has not been realized with *EDI*; only large companies are able to afford to
186 implement it, and much *EDI*-enabled *eBusiness* is centered around a dominant enterprise
187 that imposes proprietary integration approaches on its *Trading Partners*.

188

189 In the last few years, the *Extensible Markup Language (XML)* has rapidly become the
190 first choice for defining data interchange formats in new *eBusiness* applications on the
191 Internet. Many people have interpreted the XML groundswell as evidence that "EDI is
192 dead" – made completely obsolete by the XML upstart -- but this view is naïve from both
193 business and technical standpoints.

194

195 *EDI* implementations encode substantial experience in *Business Processes*, and
196 companies with large investments in *EDI* integration will not abandon them without good
197 reason. XML might enable more open, more loosely coupled, and more object- or
198 component-oriented systems than *EDI*. XML might enable more flexible and innovative
199 "eMarketplace" business models than *EDI*. But the challenges of designing messages
200 that meet *Business Process* requirements and standardizing their semantics are
201 independent of the syntax in which the messages are encoded.

202

203 The ebXML specifications provide a framework in which *EDI's* substantial investments
204 in *Business Processes* can be preserved in an architecture that exploits XML's new
205 technical capabilities.

206

207 Please consult the ebXML Requirements Specification, available at
208 <http://www.ebxml.org> for additional information on the underlying goals of ebXML.

209

210 **4.2 Caveats and Assumptions**

211 This specification is designed to provide a high level overview of ebXML, and as such,
212 does not provide the level of detail required to build ebXML applications, components,
213 and related services. Please refer to each of the respective ebXML Project Team
214 Specifications to get the level of detail.

215

216 **4.3 Design Conventions for ebXML Specifications**

217 In order to enforce a consistent Capitalization and Naming convention across all ebXML
218 specifications "Upper Camel Case" (UCC) and "Lower Camel Case" (LCC)
219 Capitalization styles SHALL be used. UCC style capitalizes the first character of each
220 word and compounds the name. LCC style capitalizes the first character of each word
221 except the first word.

222

223 1) ebXML DTD, XMLSchema and XML instance documents SHALL have the effect of
224 producing ebXML XML instance documents such that:

225

- 226 • Element names SHALL be in UCC convention (example:
227 <UpperCamelCaseElement/>).
- 228 • Attribute names SHALL be in LCC convention (example:
229 <UpperCamelCaseElement lowerCamelCaseAttribute="Whatever"/>).

230

231 2) When UML and Object Constrained Language (OCL) are used to specify ebXML
232 artifacts Capitalization naming SHALL follow the following rules:

233

- 234 • Class, Interface, Association, Package, State, Use Case, Actor names SHALL use
235 UCC convention (examples: ClassificationNode, Versionable, Active,
236 InsertOrder, Buyer).
- 237 • Attribute, Operation, Role, Stereotype, Instance, Event, Action names SHALL
238 use LCC convention (examples: name, notifySender, resident, orderArrived).
239
- 240 3) General rules for all names are:
- 241 • Acronyms SHOULD be avoided, but in cases where they are used, the
242 capitalization SHALL remain (example: XMLSignature).
- 243 • Underscore (_), periods (.) and dashes (-) MUST NOT be used (don't use:
244 header.manifest, stock_quote_5, commercial-transaction, use HeaderManifest,
245 stockQuote5, CommercialTransaction instead).

246 **5 ebXML System Overview**

247

248 Figure 1 below shows a high-level use case scenario for two *Trading Partners*, first
249 configuring and then engaging in a simple business transaction and interchange. This
250 model is provided as an example of the process and steps that may be required to
251 configure and deploy ebXML applications and related architecture components. These
252 components can be implemented in an incremental manner. The ebXML specifications
253 are not limited to this simple model, provided here as quick introduction to the concepts.
254 Specific ebXML implementation examples are described in Appendix A.

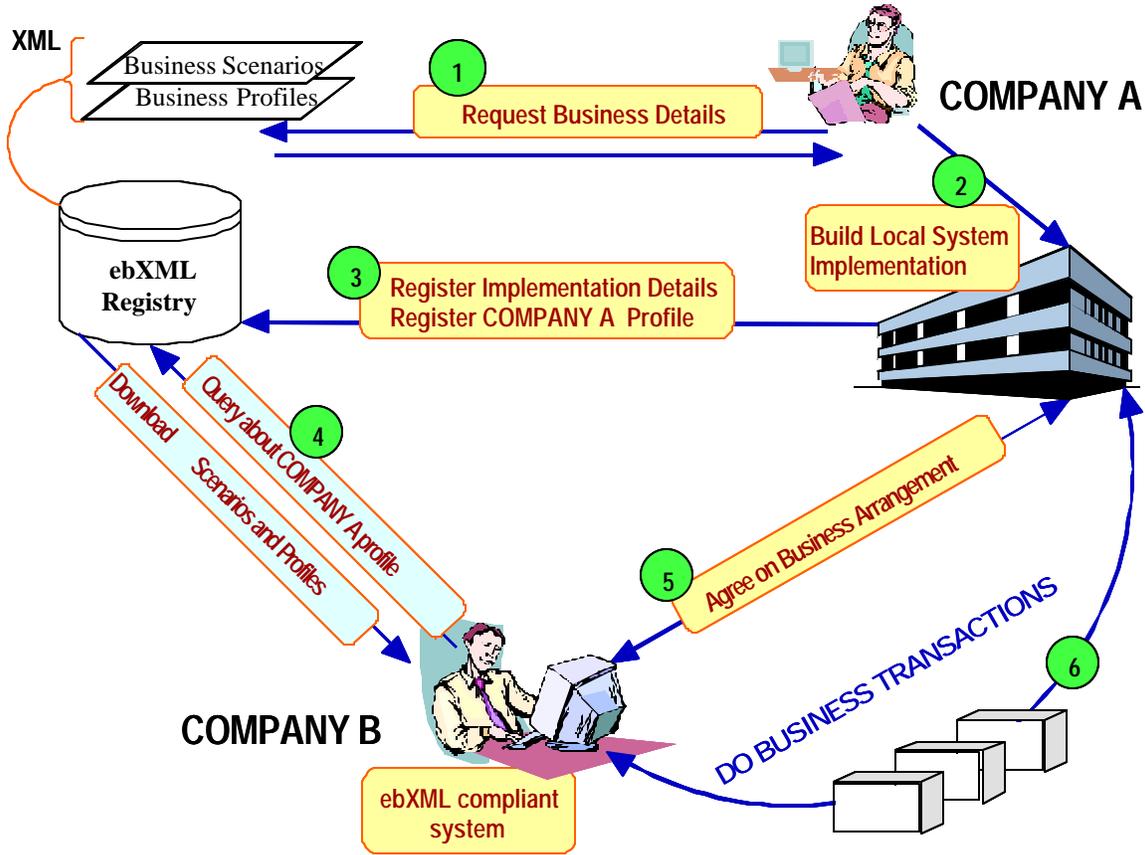

255

256 The conceptual overview described below introduces the following concepts and
257 underlying architecture:

258

- 259 1. A standard mechanism for describing a *Business Process* and its associated
260 information model.
- 261 2. A mechanism for registering and storing *Business Process and Information*
262 *Models* so they can be shared and reused.
- 263 3. Discovery of information about each participant including:
 - 264 • The *Business Processes* they support.
 - 265 • The *Business Service Interfaces* they offer in support of the *Business*
266 *Process*.
 - 267 • The *Business Messages* that are exchanged between their respective
268 *Business Service Interfaces*.
 - 269 • The technical configuration of the supported transport, security and
270 encoding protocols.
- 271 4. A mechanism for registering the aforementioned information so that it may be
272 discovered and retrieved.
- 273 5. A mechanism for describing the execution of a mutually agreed upon business
274 arrangement which can be derived from information provided by each participant
275 from item 3 above.
- 276 6. A standardized business *Messaging Service* framework that enables interoperable,
277 secure and reliable exchange of messages between *Trading Partners*.

278 7. A mechanism for configuration of the respective *Messaging Services* to engage in
 279 the agreed upon *Business Process* in accordance with the constraints defined in
 280 the business arrangement.

 297
 298
 299
 300

Figure 1 - a high level overview of the interaction of two companies conducting eBusiness using ebXML.

In Figure 1, Company A has become aware of an *ebXML Registry* that is accessible on the Internet (Figure 1, step 1). Company A, after reviewing the contents of the *ebXML Registry*, decides to build and deploy its own ebXML compliant application (Figure 1, step 2). Custom software development is not a necessary prerequisite for ebXML participation. ebXML compliant applications and components may also be commercially available as shrink-wrapped solutions.

Company A then submits its own *Business Profile Information* (including implementation details and reference links) to the *ebXML Registry* (Figure 1, step 3). The business profile submitted to the *ebXML Registry* describes the company's ebXML capabilities and constraints, as well as its supported business scenarios. These business scenarios are XML versions of the *Business Processes* and associated information bundles (e.g. a sales tax calculation) in which the company is able to engage. After receiving verification that the format and usage of a business scenario is correct, an acknowledgment is sent to Company A by the *ebXML Registry* (Figure 1, step 3).

301 Company B discovers the business scenarios supported by Company A in the ebXML
302 Registry (Figure 1, step 4). Company B sends a request to Company A stating that they
303 would like to engage in a business scenario using ebXML (Figure 1, step 5). Company B
304 acquires an ebXML compliant shrink-wrapped application.

305

306 Before engaging in the scenario Company B submits a proposed business arrangement
307 directly to Company A's ebXML compliant software interface. The proposed business
308 arrangement outlines the mutually agreed upon business scenarios and specific
309 agreements on how it wants to conduct business transactions with Company A. The
310 business arrangement also contains information pertaining to the messaging requirements
311 for transactions to take place, contingency plans, and security-related requirements
312 (Figure 1, step 5). Company A and B are now ready to engage in *eBusiness* using ebXML
313 (Figure 1, step 6).

314 **6 ebXML Recommended Modeling Methodology**

315

316 **6.1 Overview**

317 The *UN/CEFACT Modeling Methodology (UMM)* uses the following two views to
318 describe the relevant aspects of *eBusiness* transactions. This model is based upon the
319 Open-edi Reference Model, ISO/IEC 14662.

320

321 While business practices from one organization to another are highly variable, most
322 activities can be decomposed into *Business Processes* which are more generic to a
323 specific type of business. This analysis through the modeling process will identify object
324 classes and models that are likely candidates for standardization. The ebXML approach
325 looks for standard reusable components from which to construct interoperable ebXML
326 applications and components.

327

328

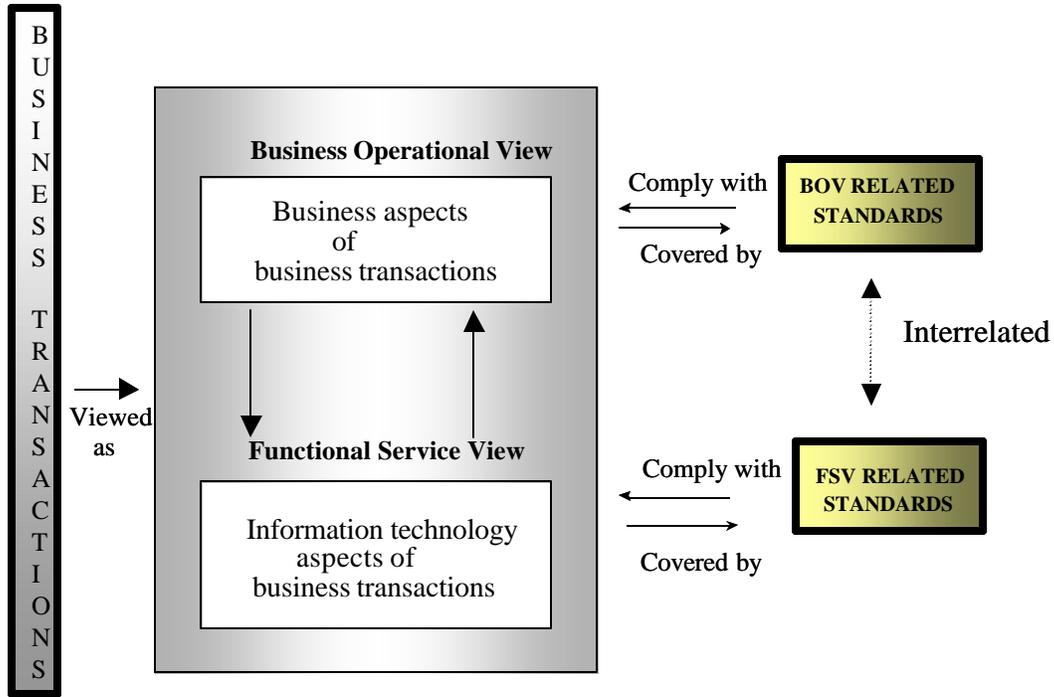

Figure 2 - ebXML Recommended Modeling Methodology

329
330

331

332 The *UMM* is broken down into the *Business Operational View (BOV)* and the supporting
 333 *Functional Service View (FSV)* described above. The assumption for ebXML is that the
 334 *FSV* serves as a reference model that MAY be used by commercial software vendors to
 335 help guide them during the development process. The underlying goal of the *UMM* is to
 336 provide a clear distinction between the operational and functional views, so as to ensure
 337 the maximum level of system interoperability and backwards compatibility with legacy
 338 systems (when applicable). As such, the resultant *BOV*-related standards provide the
 339 *UMM* for constructing business and object class models for ebXML compliant
 340 applications and components.

341

342 The *BOV* addresses:

- 343 a) The semantics of business data in transactions and associated data interchanges
 344 b) The architecture for business transactions, including:
- 345 • operational conventions;
 - 346 • agreements and arrangements;
 - 347 • mutual obligations and requirements.

348

349 These specifically apply to the business needs of ebXML *Trading Partners*.

350

351 The *FSV* addresses the supporting services meeting the mechanistic needs of ebXML. It
 352 focuses on the information technology aspects of:

353

- 354 • Functional capabilities;
- 354 • *Business Service Interfaces*;
- 355 • Protocols and *Messaging Services*.

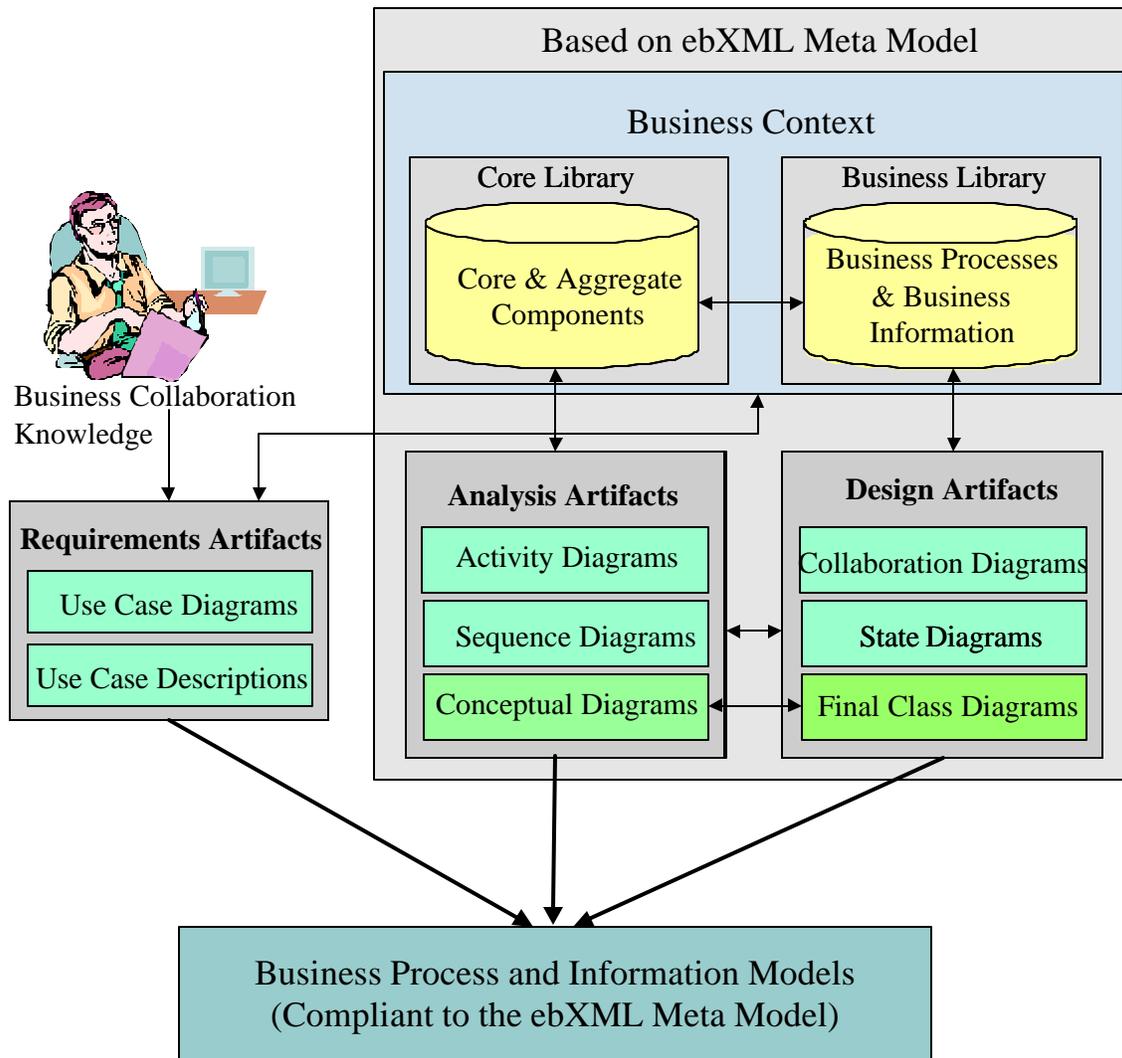

356
357
358
359
360
361
362
363
364
365
366
367
368

This includes, but is not limited to:

- Capabilities for implementation, discovery, deployment and run time scenarios;
- User interfaces;
- Data transfer infrastructure interfaces;
- *Protocols* for enabling interoperability of XML vocabulary deployments from different organizations.

6.2 ebXML Business Operational View

The modeling techniques described in this section are not mandatory requirements for participation in ebXML compliant business transactions.

369
370
371
372

Figure 3 – detailed representation of the Business Operational View

373 In Figure 3 above, *Business Collaboration Knowledge* is captured in a *Core Library*. The
374 *Core Library* contains data and process definitions, including relationships and cross-
375 references, as expressed in business terminology that MAY be tied to an accepted
376 industry classification scheme or taxonomy. The *Core Library* is the bridge between the
377 specific business or industry language and the knowledge expressed by the models in a
378 more generalized context neutral language.

379

380 The first phase defines the requirements artifacts that describe the problem using *Use*
381 *Case Diagrams and Descriptions*. If *Core Library* entries are available from an ebXML
382 compliant *Registry* they will be utilized, otherwise new *Core Library* entries will be
383 created and registered in an ebXML compliant *Registry*.

384

385 The second phase (analysis) will create activity and sequence diagrams (as defined in the
386 *UN/CEFACT Modeling Methodology* specification) describing the *Business Processes*.
387 *Class Diagrams* will capture the associated information parcels (business documents).
388 The analysis phase reflects the business knowledge contained in the *Core Library*. No
389 effort is made to force the application of object-oriented principles. The class diagram is
390 a free structured data diagram. Common *Business Processes* in the Business Library
391 MAY be referenced during the process of creating analysis and design artifacts.

392

393 The design phase is the last step of standardization, which MAY be accomplished by
394 applying object-oriented principles based on the *UN/CEFACT Modeling Methodology*. In
395 addition to generating collaboration diagrams, a state diagram MAY also be created. The
396 class view diagram from the analysis phase will undergo harmonization to align it with
397 other models in the same industry and across others.

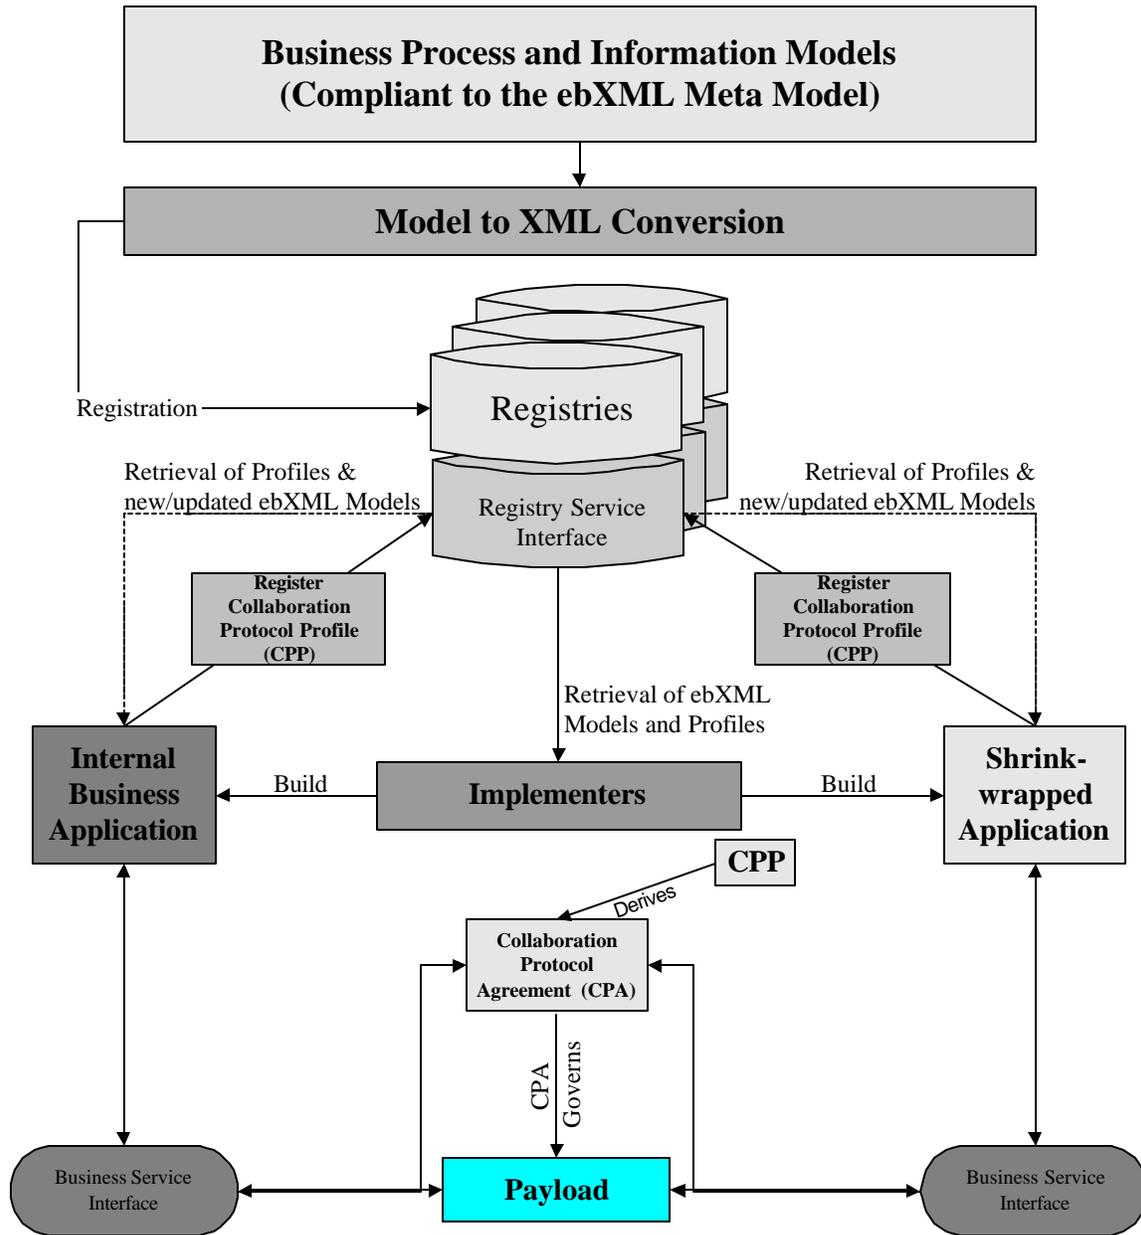

398

399 In ebXML, interoperability is achieved by applying *Business Information Objects* across
400 all class models. *Business Processes* are created by applying the *UN/CEFACT Modeling*
401 *Methodology (UMM)* which utilizes a common set of *Business Information Objects* and
402 *Core Components*.

403

404
405

6.3 ebXML Functional Service View

406
407
408
409

Figure 4 - ebXML Functional Service View

410 As illustrated in Figure 4 above, the *ebXML Registry* system serves as the storage facility
 411 for the *Business Process and Information Models*, the XML-based representations of
 412 those models, *Core Components*, and *Collaboration Protocol Profiles*. The *Business*
 413 *Process and Information Meta Models* MAY be stored in modeling syntax, however they
 414 MAY be also stored as XML syntax in the Registry. This XML-based business
 415 information SHALL be expressed in a manner that allows discovery down to the atomic
 416 data level via a consistent methodology.

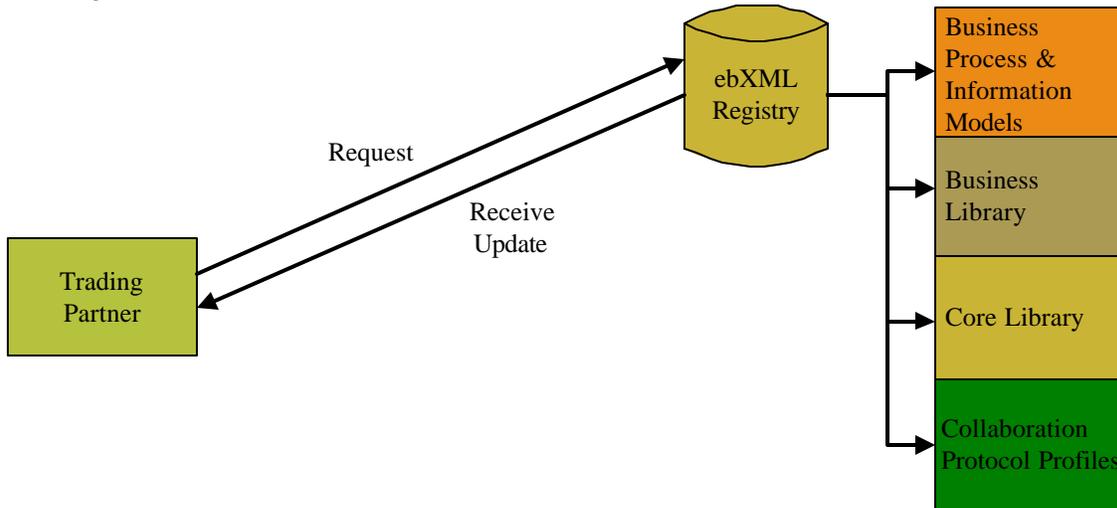

417
 418 The underlying ebXML Architecture is distributed in such a manner to minimize the
 419 potential for a single point of failure within the ebXML infrastructure. This specifically
 420 refers to *Registry Services* (see Registry Functionality, Section 8.4 for details of this
 421 architecture).

422 **7 ebXML Functional Phases**

423
 424 **7.1 Implementation Phase**
 425

426 The implementation phase deals specifically with the procedures for creating an
 427 application of the ebXML infrastructure. A *Trading Partner* wishing to engage in an
 428 ebXML compliant transaction, must first acquire a copy of the ebXML Framework
 429 Specifications. The *Trading Partner* studies these specifications and subsequently
 430 requests to download the *Core Library* and the *Business Library*. The *Trading Partner*
 431 MAY also request other *Trading Partners'* *Business Process* information (stored in their
 432 business profile) for analysis and review. The *Trading Partner* can also submit its own
 433 *Business Process* information to an ebXML compliant *Registry* system.
 434

435 Figure 5 below, illustrates a basic interaction between an ebXML *Registry* system and a
 436 *Trading Partner*.

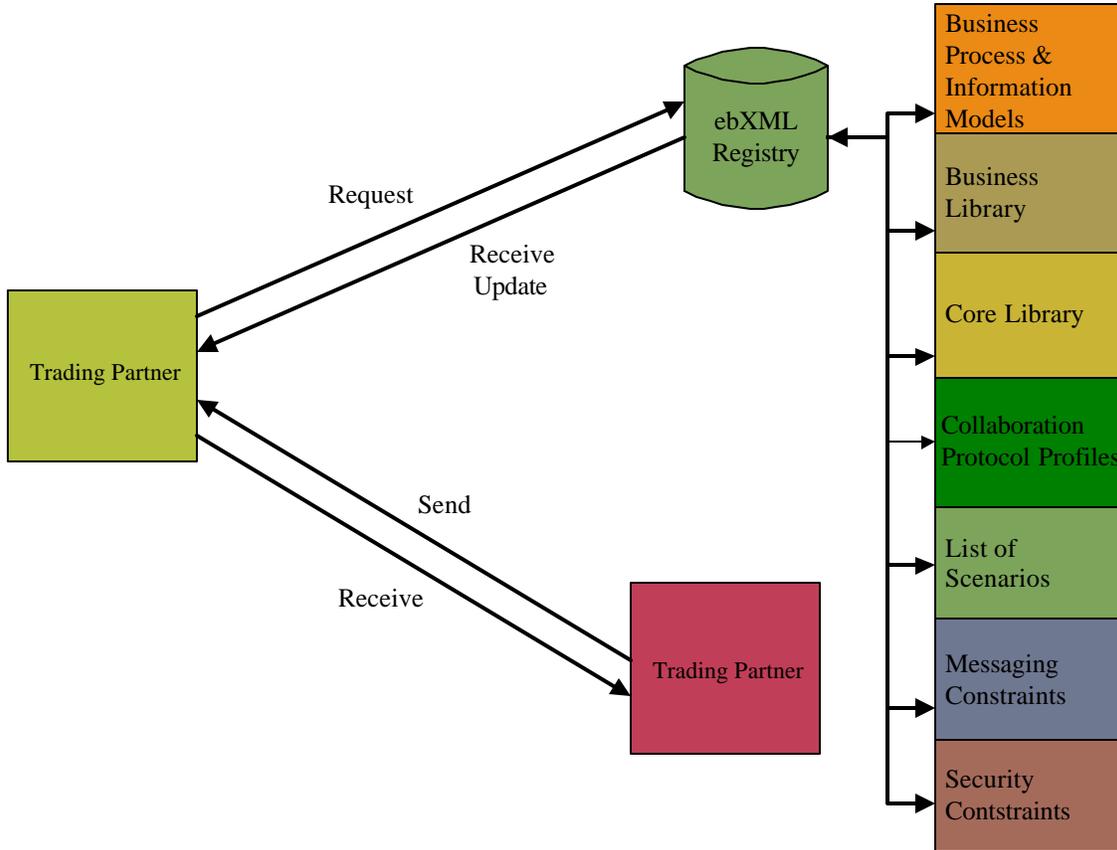

437
 438
 439 **Figure 5 - Functional Service View: Implementation Phase**
 440

441 **7.2 Discovery and Retrieval Phase**
 442

443 The Discovery and Retrieval Phase covers all aspects of actual discovery of ebXML
 444 related resources and self enabled into the ebXML infrastructure. A *Trading Partner* who
 445 has implemented an ebXML *Business Service Interface* can now begin the process of
 446 discovery and retrieval (Figure 6 below). One possible discovery method may be to
 447 request the *Collaboration Protocol Profile* of another *Trading Partner*. Requests for
 448 updates to *Core Libraries*, *Business Object Libraries* and updated or new *Business*

449 *Process* and information models SHOULD be supported by an ebXML *Business Service*
 450 *Interface*. This is the phase where *Trading Partners* discover the meaning of business
 451 information being requested by other *Trading Partners*.
 452

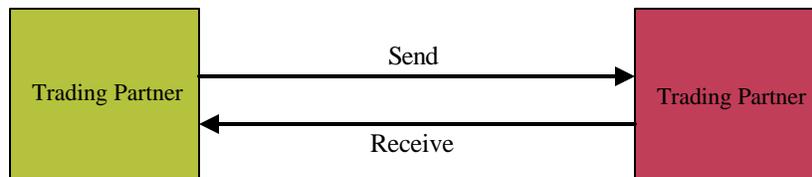

453
 454
 455
 456

Figure 6 - Functional Service View: Discovery and Retrieval Phase

457 **7.3 Run Time Phase**

458
 459
 460
 461
 462
 463
 464

The Run Time phase covers the execution of an ebXML scenario with the actual associated ebXML transactions. In the Run Time Phase, ebXML messages are being exchanged between *Trading Partners* utilizing the *ebXML Messaging Service*. For example, an ebXML CPA is a choreographed set of business message exchanges linked together by a well-defined choreography using the *ebXML Messaging Service*.

465
 466
 467

Figure 7 - Functional Service View: Run Time Phase

468
469 [NOTE: If it becomes necessary to make calls to the Registry during the Run Time, this
470 SHOULD be considered as a reversion to the Discovery and Retrieval Phase.]
471

472 **8 ebXML Infrastructure**

473

474 **8.1 Trading Partner Information [CPP and CPA's]**

475

476 **8.1.1 Introduction**

477 To facilitate the process of conducting *eBusiness*, potential *Trading Partners* need a
478 mechanism to publish information about the *Business Processes* they support along with
479 specific technology implementation details about their capabilities for exchanging
480 business information. This is accomplished through the use of a *Collaboration Protocol*
481 *Profile (CPP)*. The *CPP* is a document which allows a *Trading Partner* to express their
482 supported *Business Processes* and *Business Service Interface* requirements in a manner
483 where they can be universally understood by other ebXML compliant *Trading Partners*.
484

485 To facilitate the process of conducting *eBusiness*, organizations also need a mechanism to
486 publish information about the *Business Processes* they support, along with specific
487 technology details about their capabilities for sending and receiving business documents.
488 ebXML defines the ability for this to be realized under the broad notion of a
489 *Collaboration*.

490

491 **8.1.2 CPP Formal Functionality**

492 The *CPP* describes the specific capabilities that a *Trading Partner* supports as well as the
493 *Service Interface* requirements that need to be met in order to exchange business
494 documents with that *Trading Partner*. Each *Trading Partner* MAY register one or more
495 *CPP* documents within an ebXML compliant Registry system. The *CPP* contains
496 essential information about the *Trading Partner* including, but not limited to: contact
497 information, industry classification, supported *Business Processes*, interface requirements
498 and *Messaging Service* requirements. *CPP's* MAY also contain security and other
499 implementation specific details. Each ebXML compliant *Trading Partner* SHOULD
500 register their *CPP* in an ebXML compliant *Registry* system, thus providing a discovery
501 mechanism that allows *Trading Partners* to (1) find one another, (2) discover the
502 *Business Process* that other *Trading Partners* support.

503

504 **8.1.3 CPA Formal Functionality**

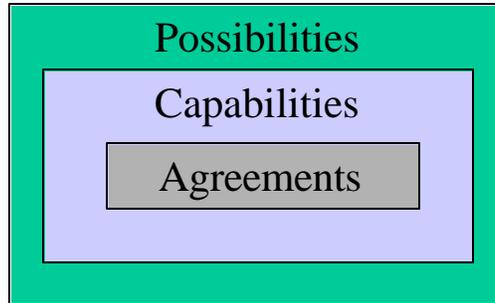

505 A *Collaboration Protocol Agreement (CPA)* is a document that represents the
506 intersection of two *CPP's* and is mutually agreed upon by both *Trading Partners* who
507 wish to conduct *eBusiness* using ebXML.

508

509 A *CPA* describes: (1) the *Messaging Service* and (2) the *Business Process* requirements
510 that are agreed upon by two or more *Trading Partners*. Conceptually, ebXML supports a
511 three level view of narrowing subsets to arrive at *CPA's* for transacting *eBusiness*. The

512 outer-most scope relates to all of the capabilities that a *Trading Partner* can support, with
513 a subset of what a *Trading Partner* “will” actually support.

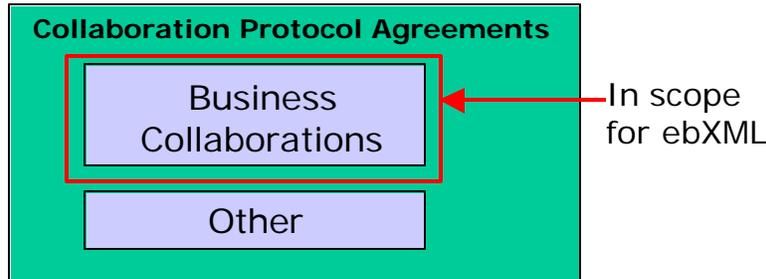

514
515 A *CPA* contains the *Messaging Service* interface requirements as well as the
516 implementation details pertaining to the mutually agreed upon *Business Processes* that
517 both *Trading Partners* agree to use to conduct *eBusiness*. *Trading Partners* may decide to
518 register their *CPA*’s in an ebXML compliant *Registry* system, but this is not a mandatory
519 part of the *CPA* creation process.

520
521
522 *Figure 8 - Three level view of CPA's*
523

524 *Business Collaborations* are the first order of support that can be claimed by ebXML
525 *Trading Partners*. This “claiming of support” for specific *Business Collaborations* is
526 facilitated by a distinct profile defined specifically for publishing, or advertising in a
527 directory service, such as an ebXML *Registry* or other available service. Figure 9 below
528 outlines the scope for *Collaboration Protocol Agreements* within ebXML.

529

530
531
532 *Figure 9 - Scope for CPA's*
533

534 The *CPA-CPP* specification includes a non-normative appendix that discusses CPA
535 composition and negotiation and includes advice as to composition and negotiation
536 procedures

537

538 **8.1.4 CPP Interfaces**

539

540 **Interface to Business Processes**

541 A *CPP* SHALL be capable of referencing one or more *Business Processes* supported by
542 the *Trading Partner* owning the *CPP* instance. The *CPP* SHALL reference the Roles
543 within a *Business Process* that the user is capable of assuming. An example of a Role
544 could be the notion of a “Seller” and “Buyer” within a “Purchasing” *Business Process*.

545
546 The *CPP* SHALL be capable of being stored and retrieved from an ebXML Registry
547 Mechanism

548
549 A *CPP* SHOULD also describe binding details that are used to build an *ebXML Message*
550 *Header*.

551

552 **8.1.5 CPA Interfaces**

553 A *CPA* governs the *Business Service Interface* used by a *Trading Partner* by the fact that
554 it constrains the *Business Service Interface* configuration to a set of parameters agreed to
555 by all *Trading Partners* who will use that interface for a given *Business Process*.

556

557 *CPA*'s have interfaces to *CPP*'s in that the *CPA* is derived through a process of mutual
558 negotiation narrowing the *Trading Partners* Capabilities (*CPP*) into what the *Trading*
559 *Partner* “will” do (*CPA*).

560

561 A *CPA* must reference to a specific *Business Process* and the interaction requirements
562 needed to execute that *Business Process* during the *Negotiation Phase*.

563

564 A *CPA* MAY be stored in a Registry mechanism, hence an implied ability to be stored
565 and retrieved is present.

566

567 **8.1.6 Non-Normative Implementation Details [CPP and CPA's]**

568

569 A *CPA* is negotiated after the *Discovery and Retrieval Phase* and is essentially a snapshot
570 of the *Messaging Services* and *Business Process* related information that two or more
571 *Trading Partners* agree to use to exchange business information. If any parameters
572 contained within an accepted *CPA* change after the agreement has been executed, a new
573 *CPA* SHALL be negotiated between *Trading Partners*.

574

575 In some circumstances there may be a need or desire to describe casual, informal or
576 implied *CPA*'s.

577

578 A *CPA* negotiation protocol SHALL be defined by the ebXML TP Project Team or by
579 some other working group with a mandate to write a consistent methodology for
580 negotiating *CPA*'s from *CPP*'s..

581

582

583 **8.2 Business Process and Information Modeling**

584

585 **8.2.1 Introduction**

586 The ebXML *Business Process and Information Meta Model* is a mechanism that allows
 587 *Trading Partners* to capture the details for a specific business scenario using a consistent
 588 modeling methodology. A *Business Process* describes in detail how *Trading Partners*
 589 take on roles, relationships and responsibilities to facilitate interaction with other *Trading*
 590 *Partners* in shared collaborations. The interaction between roles takes place as a
 591 choreographed set of *Business Transactions*. Each *Business Transaction* is expressed as
 592 an exchange of electronic *Business Documents*. *Business Documents* MAY be composed
 593 from re-useable *Business Information Objects* (see “Relationships to Core Components”
 594 under 8.2.3 “Interfaces” below). At a lower level, *Business Processes* can be composed
 595 of re-useable *Core Processes*, and *Business Information Objects* can be composed of re-
 596 useable *Core Components*.

597

598 The ebXML *Business Process and Information Meta Model* supports requirements,
 599 analysis and design viewpoints that provide a set of semantics (vocabulary) for each
 600 viewpoint and forms the basis of specification of the objects and artifacts that are
 601 required to facilitate *Business Process* and information integration and interoperability.

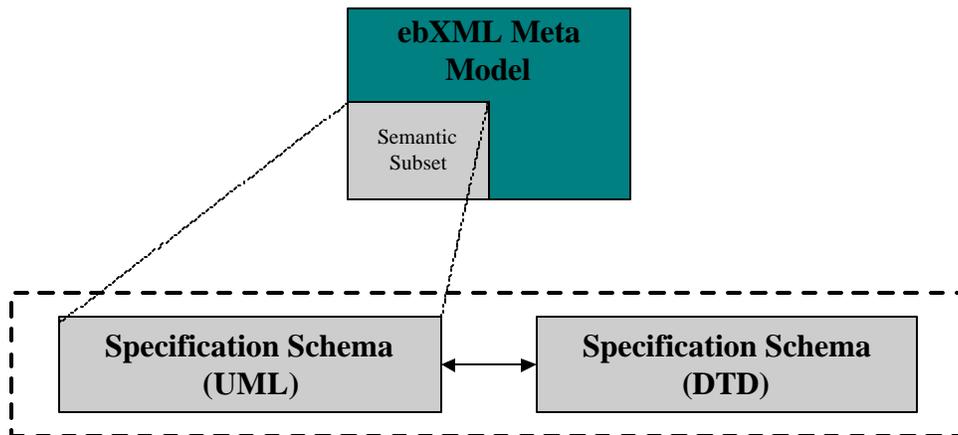

602

603 An additional view of the *Meta Model*, the *Specification Schema*, is also provided to
 604 support the direct specification of the set of elements required to configure a runtime
 605 system in order to execute a set of ebXML business transactions. By drawing out
 606 modeling elements from several of the other views, the *Specification Schema* forms a
 607 semantic subset of the ebXML *Business Process and Information Meta Model*. The
 608 *Specification Schema* is available in two stand-alone representations, a *UML* profile, and
 609 a DTD.

610

611 The relationship between the ebXML *Business Process and Information Meta Model* and
 612 the ebXML *Specification Schema* can be shown as follows:

613

614

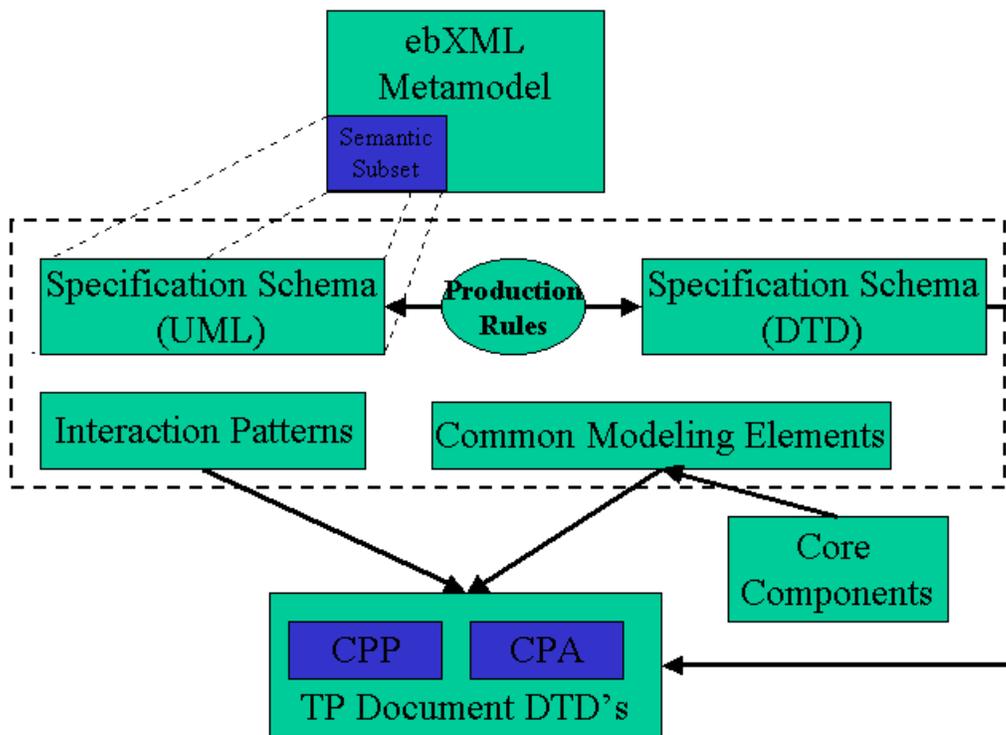

615

616

617

Figure 10 - ebXML Meta Model - Semantic Subset

618 The *Specification Schema* supports the specification of *Business Transactions* and the
 619 choreography of *Business Transactions* into *Business Collaborations*. Each *Business*
 620 *Transaction* can be implemented using one of many available standard patterns. These
 621 patterns determine the actual exchange of messages and signals between *Trading*
 622 *Partners* to achieve the required electronic transaction. To help specify the patterns *the*
 623 *Specification Schema* is accompanied by a set of standard patterns, and a set of modeling
 624 elements common to those patterns. The full specification of a *Business Process* consists
 625 of a *Business Process and Information Meta Model* specified against the *Specification*
 626 *Schema* and an identification of the desired pattern(s). This information serves as the
 627 primary input for the formation of *Collaboration Protocol Profiles (CPP's)* and *CPA's*.
 628 This can be shown as follows:

629
 630
 631
 632
 633
 634
 635
 636
 637
 638
 639

Figure 11 - ebXML Meta Model

There are no formal requirements to mandate the use of a modeling language to compose new *Business Processes*, however, if a modeling language is used to develop *Business Processes*, it SHALL be the *Unified Modeling Language (UML)*. This mandate ensures that a single, consistent modeling methodology is used to create new *Business Processes*. One of the key benefits of using a single consistent modeling methodology is that it is possible to compare models to avoid duplication of existing *Business Processes*.

640 To further facilitate the creation of consistent *Business Processes* and information
641 models, ebXML will define a common set of *Business Processes* in parallel with a *Core*
642 *Library*. It is possible that users of the ebXML infrastructure may wish to extend this set
643 or use their own *Business Processes*.

644

645 **8.2.2 Formal Functionality**

646 The representation of a *Business Process* document instance SHALL be in a form that
647 will allow both humans and applications to read the information. This is necessary to
648 facilitate a gradual transition to full automation of business interactions.

649

650 The *Business Process* SHALL be storable and retrievable in a *Registry* mechanism.
651 *Business Processes* MAY be registered in an ebXML *Registry* in order to facilitate
652 discovery and retrieval.

653

654 To be understood by an application, a *Business Process* SHALL be expressible in XML
655 syntax. A *Business Process* MAY be constructed as an *Information Meta Model* or an
656 XML representation of that model. *Business Processes* are capable of expressing the
657 following types of information:

- 658 • Choreography for the exchange of document instances. (e.g. the choreography of
659 necessary message exchanges between two Trading Partners executing a
660 “Purchasing” ebXML transaction.)
- 661 • References to *Business Process and Information Models* or *Business Documents*
662 (possibly *DTD's* or *Schemas*) that add structure to business data.
- 663 • Definition of the roles for each participant in a *Business Process*.

664 A *Business Process*:

- 665 • Provides the contextual constraints for using *Core Components*
- 666 • Provides the framework for establishing *CPAs*
- 667 • Specifies the domain owner of a *Business Process*, along with relevant contact
668 information.

669 [NOTE: the above lists are not inclusive.]

670

671 **8.2.3 Interfaces**

672

673 **Relationship to CPP and CPA**

674 The *CPP* instance of a *Trading Partner* defines that partner’s functional and technical
675 capability to support zero, one, or more *Business Processes* and one or more roles in each
676 process.

677

678 The agreement between two *Trading Partners* defines the actual conditions under which
679 the two partners will conduct business transactions together. The interface between the
680 *Business Process*, its *Information Meta Model*, and the *CPA* is the part of the *Business*
681 *Process* document. This MAY be instantiated as an XML document representing the
682 business transactional and collaboration layers of the *Business Process and Information*
683 *Meta Model*. The expression of the sequence of commercial transactions in XML is
684 shared between the *Business Process* and *Trading Partner Information* models.

685

686 **Relationship to Core Components**

687 A *Business Process* instance SHOULD specify the constraints for exchanging business
 688 data with other *Trading Partners*. The business information MAY be comprised of
 689 components of the ebXML *Core Library*. A *Business Process* document SHALL
 690 reference the *Core Components* directly or indirectly using a XML document that
 691 references the appropriate Business and Information Models and/or Business Documents
 692 (possibly DTD's or Schemas). The mechanism for interfacing with the *Core Components*
 693 and *Core Library* SHALL be by way of a unique identifier for each component.
 694

695 **Relationship to ebXML Messaging**

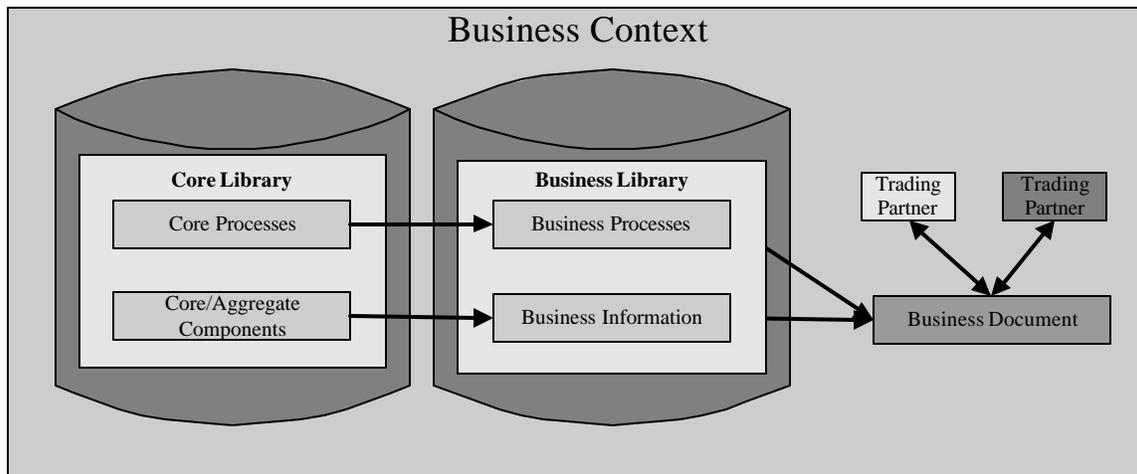

696 A *Business Process* instance SHALL be capable of being transported from a *Registry*
 697 *Service* to another *Registry Service* via an *ebXML Message*. It SHALL also be capable of
 698 being transported between a *Registry* and a users application via the *ebXML Messaging*
 699 *Service*.
 700

701 **Relationship to a Registry System**

702 A *Business Process* instance intended for use within the ebXML infrastructure SHALL
 703 be retrievable through a Registry query, and therefore, each *Business Process* SHALL
 704 contain a unique identifier.
 705

706 **8.2.4 Non-Normative Implementation Details**

707 The exact composition of *Business Information Objects* or a *Business Document* is
 708 guided by a set of contexts derived from the *Business Process*. The modeling layer of the
 709 architecture is highlighted in green in Figure 12 below.
 710

711
 712 **Figure 12 – ebXML Business Process and Information Modeling layer**
 713
 714

715 ebXML *Business Process and Information Models* MAY be created following the
 716 recommended UN/CEFACT *Modeling Methodology (UMM)*, or MAY be arrived at in
 717 any other way, as long as they comply with the ebXML *Business Process and*
 718 *Information Meta Model*.
 719

720 **8.3 Core Components and Core Library Functionality**

721

722 **8.3.1 Introduction**

723

724 A *Core Component* captures information about a real world business concept, and the
725 relationships between that concept, other *Business Information Objects*, and a contextual
726 description that describes how a *Core* or *Aggregate Component* may be used in a
727 particular ebXML *eBusiness* scenario.

728

729 A *Core Component* can be either an individual piece of business information, or a natural
730 “go-together” family of *Business Information Objects* that may be assembled into
731 *Aggregate Components*.

732

733 The *ebXML Core Components Project Team* SHALL define an initial set of *Core*
734 *Components*. ebXML users may adopt and/or extend components from the ebXML *Core*
735 *Library*.

736

737 **8.3.2 Formal Functionality**

738

739 As a minimum set of requirements, *Core Components* SHALL facilitate the following
740 functionality:

741

742 *Core Components* SHALL be storable and retrievable using an ebXML *Registry*
743 *Mechanism*.

744

745 *Core Components* SHALL capture and hold a minimal set of information to satisfy
746 *eBusiness* needs.

747

748 *Core Components* SHALL be capable of being expressed in XML syntax.

749

750 A *Core Component* SHALL be capable of containing:

751

- 752 • Another *Core Component* in combination with one or more individual pieces of
753 *Business Information Objects*.

754

- 755 • Other *Core Components* in combination with zero or more individual pieces of
756 *Business Information Objects*.

757

758 A *Core Component* SHALL be able to be uniquely identified.

759

760 **8.3.3 Interfaces**

761

762 A *Core Component* MAY be referenced indirectly or directly from a *Business Document*
763 instance. The *Business Process* MAY specify a single or group of *Core Components* as
764 required or optional information as part of a *Business Document* instance.

765

766 A *Core Component* SHALL interface with a *Registry* mechanism by way of being
 767 storable and retrievable in such a mechanism.

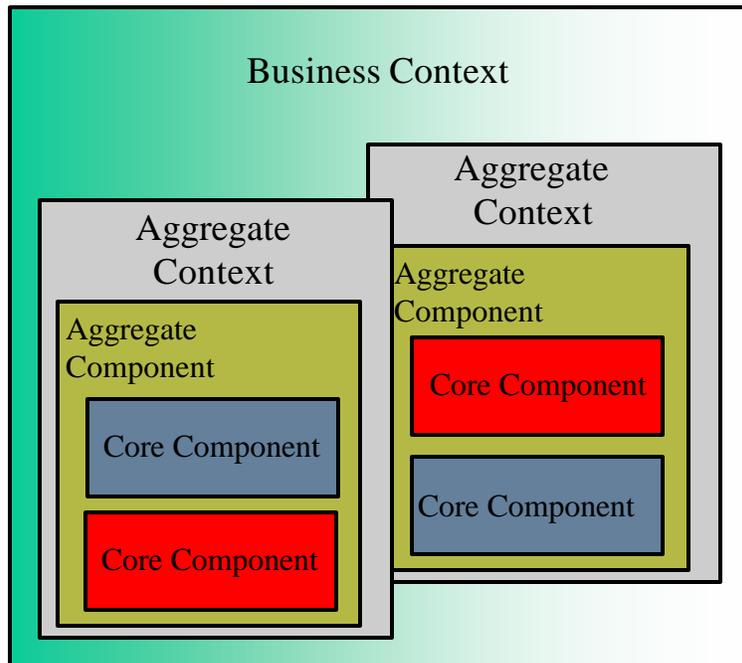

768
 769 A *Core Component* MAY interface with an XML Element from another XML
 770 vocabulary by the fact it is bilaterally or unilaterally referenced as a semantic equivalent.
 771

772
 773 **8.3.4 Non-Normative Implementation Details**
 774

775 A *Core Component* MAY contain attribute(s) or be part of another *Core Component*, thus
 776 specifying the precise context or combination of contexts in which it is used.
 777

778 The process of aggregating *Core Components* for a specific business context, shall
 779 include a means to identify the placement of a *Core Component* within another *Core*
 780 *Component*. It MAY also be a combination of structural contexts to facilitate *Core*
 781 *Component* re-use at different layers within another *Core Component* or *Aggregate*
 782 *Component*. This is referred to as *Business Context*.

783
 784 Context MAY also be defined using the *Business Process and Information Meta Model*,
 785 which defines the instances of *Business Information Objects* in which the *Core*
 786 *Component* occurs.
 787

788
 789
 790 **Figure 13 - Business Context defined in terms of Aggregate Context and Aggregate and Core Components**
 791

792 The pieces of *Business Information Objects*, or *Core Components*, within a generic *Core*
 793 *Component* may be either mandatory, or optional. A *Core Component* in a specific

794 context or combination of contexts (aggregate or business context) may alter the
 795 fundamental mandatory/optional cardinality.

796

797 **8.4 Registry Functionality**

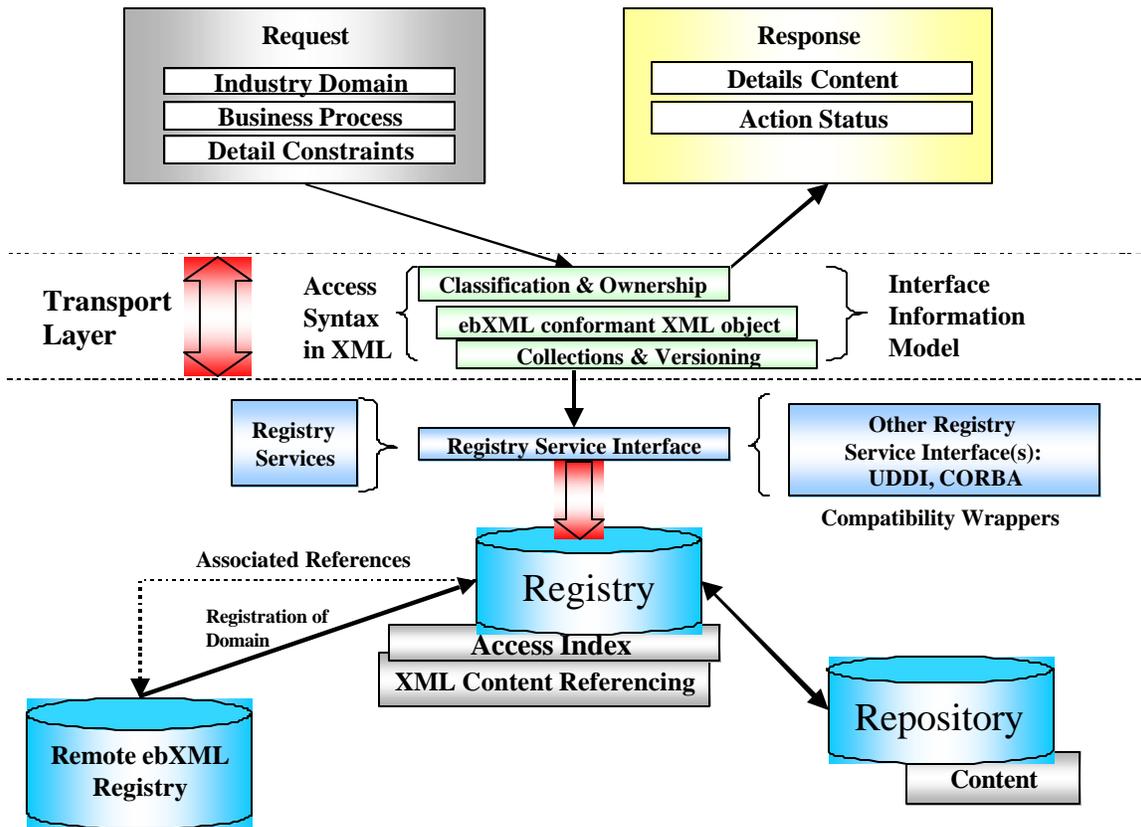

798

799 **8.4.1 Introduction**

800 An *ebXML Registry* provides a set of services that enable the sharing of information
 801 between *Trading Partners*. A *Registry* is a component that maintains an interface to
 802 metadata for a registered item. Access to an *ebXML Registry* is provided through
 803 interfaces (APIs) exposed by *Registry Services*.

804

805

806

807

808

809

810 **8.4.2 Formal Functionality**

811 A *Registry* SHALL accommodate the storage of items expressed in syntax using multi-
 812 byte character sets.

813

814 Each *Registry Item*, at each level of granularity as defined by the *Submitting*
 815 *Organization*, MUST be uniquely identifiable. This is essential to facilitate application-
 816 to-Registry queries.

817

Figure 14 - Overall Registry / Repository Architecture.

818 A *Registry* SHALL return either zero or one positive matches in response to a contextual
819 query for a unique identifier. In such cases where two or more positive results are
820 displayed for such queries, an error message SHOULD be reported to the *Registry*
821 *Authority*.

822
823 A *Registry Item* SHALL be structured to allow information associations that identify,
824 name, describe it, give its administrative and access status, define its persistence and
825 mutability, classify it according to pre-defined classification schemes, declare its file
826 representation type, and identify the submitting and responsible organizations.

827
828 The *Registry Interface* provides an application-to-registry automated access. Human-to-
829 Registry interactions SHALL be built as a layer over a *Registry Interface* (e.g. a Web
830 browser) and not as a separate interface.

831
832 The *Registry Interface* SHALL be designed to be independent of the underlying network
833 protocol stack (e.g. HTTP/SMTP over TCP/IP). Specific instructions on how to interact
834 with the *Registry Interface* SHALL be contained in the payload of the ebXML Message.

835
836 The processes supported by the *Registry* MAY also include:

- 837 • A special *CPA* between the *Registry* and *Registry Clients*.
- 838 • A set of functional processes involving the *Registry* and *Registry Clients*.
- 839 • A set of *Business Messages* exchanged between a Registry Client and the *Registry*
840 as part of a specific *Business Process*.
- 841 • A set of primitive interface mechanisms to support the *Business Messages* and
842 associated query and response mechanisms.
- 843 • A special *CPA* for orchestrating the interaction between ebXML compliant
844 Registries.
- 845 • A set of functional processes for *Registry-to-Registry* interactions.
- 846 • A set of error responses and conditions with remedial actions.

847
848 To facilitate the discovery process, browse and drill down queries MAY be used for
849 human interactions with a *Registry* (e.g. via a Web browser). A user SHOULD be able to
850 browse and traverse the content based on the available *Registry* classification schemes.

851
852 Registry Services exist to create, modify, and delete *Registry Items* and their metadata.

853
854 Appropriate security protocols MAY be deployed to offer authentication and protection
855 for the *Repository* when accessed by the *Registry*.

856
857 *Unique Identifiers (UIDs)* SHALL be assigned to all items within an *ebXML Registry*
858 *System*. *UID* keys are REQUIRED references for all ebXML content. *Universally Unique*
859 *Identifiers (UUIDs)* MAY be used to ensure that *Registry* entries are truly globally
860 unique, and thus when systems query a *Registry* for a *UUID*, one and only one result
861 SHALL be retrieved.

862

863 To facilitate semantic recognition of *Business and Information Meta Models*, the *Registry*
864 system SHALL provide a mechanism for incorporating human readable descriptions of
865 *Registry* items. Existing *Business Process and Information Models* (e.g. RosettaNet PIPs)
866 and *Core Components* SHALL be assigned *UID* keys when they are registered in an
867 ebXML compliant *Registry* system. These *UID* keys MAY be implemented in physical
868 XML syntax in a variety of ways. These mechanisms MAY include, but are not limited
869 to:

870

- 871 • A pure explicit reference mechanism (example: URN:*UID* method),
- 872 • A referential method (example: URI:*UID* / namespace:*UID*),
- 873 • An object-based reference compatible with W3C Schema (*example*
- 874 URN:complextype name), and
- 875 • A datatype based reference (example: ISO 8601:2000 Date/Time/Number
- 876 datatyping and then legacy datatyping).
- 877

878 Components in ebXML MUST facilitate multilingual support. A *UID* reference is
879 particularly important here as it provides a language neutral reference mechanism. To
880 enable multilingual support, the ebXML specification SHALL be compliant with
881 Unicode and ISO/IEC 10646 for character set and UTF-8 or UTF-16 for character
882 encoding.

883

884 8.4.3 Interfaces

885

886 **ebXML Messaging :**

887 The query syntax used by the *Registry* access mechanisms is independent of the physical
888 implementation of the backend system.

889

890 The ebXML *Messaging Service* serves as the transport mechanism for all
891 communications into and out of the *Registry*.

892

893 **Business Process:**

894 *Business Processes* are published and retrieved via ebXML *Registry* services.

895

896 **Core Components:**

897 *Core Components* are published and retrieved via ebXML *Registry* services.

898

899 **Any item with metadata:** XML elements provide standard metadata about the item
900 being managed through ebXML *Registry* services. Since ebXML Registries are
901 distributed each *Registry* MAY interact with and cross-reference another ebXML
902 *Registry*.

903

904 8.4.4 Non-Normative Implementation Details

905 The *Business Process and Information Model* within a *Registry* MAY be stored
906 according to various classification schemes.

907

908 The existing ISO11179/3 work on *Registry* implementations MAY be used to provide a
 909 model for the *ebXML Registry* implementation.

910
 911 *Registry Items* and their metadata MAY also be addressable as *XML* based URI
 912 references using only HTTP for direct access.

913
 914 Examples of extended Registry services functionality may be deferred to a subsequent
 915 phase of the ebXML initiative. This includes, but is not limited to transformation
 916 services, workflow services, quality assurance services and extended security
 917 mechanisms.

918
 919 A *Registry* service MAY have multiple deployment models as long as the *Registry*
 920 interfaces are ebXML compliant.

921
 922 The *Business Process and Information Model* for an *ebXML Registry* service may be an
 923 extension of the existing *OASIS Registry Information Model*, specifically tailored for the
 924 storage and retrieval of business information, whereas the OASIS model is a superset
 925 designed for handling extended and generic information content.

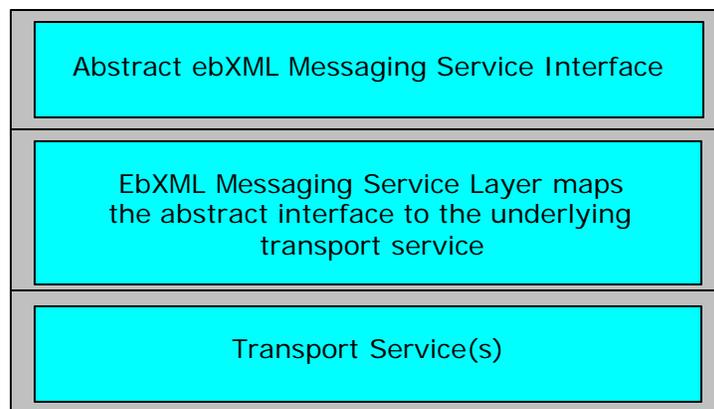

926
 927 **8.5 Messaging Service Functionality**

928
 929 **8.5.1 Introduction**

930 The *ebXML Message Service* mechanism provides a standard way to exchange business
 931 messages among *ebXML Trading Partners*. The *ebXML Messaging Service* provides a
 932 reliable means to exchange business messages without relying on proprietary
 933 technologies and solutions. An *ebXML Message* contains structures for a *Header*
 934 (necessary for routing and delivery) and a *Payload* section.

935
 936 The *ebXML Messaging Service* is conceptually broken down into three parts: (1) an
 937 abstract *Service Interface*, (2) functions provided by the *Messaging Service Layer*, and
 938 (3) the mapping to underlying transport service(s). The relation of the abstract interface,
 939 *Messaging Service Layer*, and transport service(s) are shown in Figure 15 below.

940

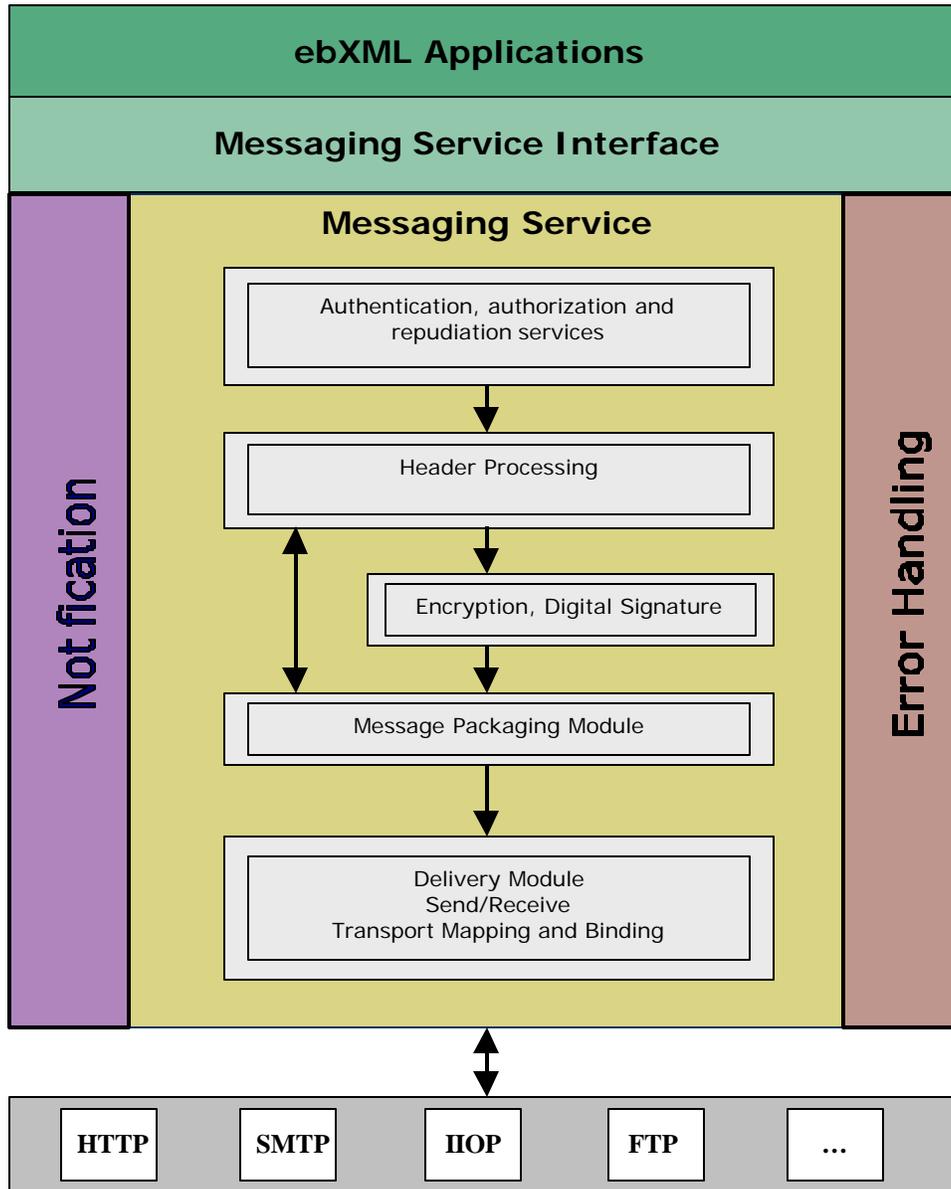

941
 942

943
944
945
946
947
948
949
950

Figure 15 - ebXML Messaging Service

The following diagram depicts a logical arrangement of the functional modules that exist within the ebXML Messaging Services architecture. These modules are arranged in a manner to indicate their inter-relationships and dependencies. This architecture diagram illustrates the flexibility of the ebXML Messaging Service, reflecting the broad spectrum of services and functionality that may be implemented in an ebXML system.

951
952
953

Figure 16 - The Messaging Service Architecture

954 **8.5.2 Formal Functionality**

955 The *ebXML Messaging Service* provides a secure, consistent and reliable mechanism to
956 exchange *ebXML Messages* between users of the ebXML infrastructure over various
957 transport *Protocols* (possible examples include SMTP, HTTP/S, FTP, etc.).

958
959 The *ebXML Messaging Service* prescribes formats for all messages between distributed
960 ebXML *Components* including *Registry* mechanisms and compliant user *Applications*.

961
962 The *ebXML Messaging Service* does not place any restrictions on the content of the
963 payload.

964
965 The *ebXML Messaging Service* supports simplex (one-way) and request/response (either
966 synchronous or asynchronous) message exchange s.

967
968 The *ebXML Messaging Service* supports sequencing of payloads in instances where
969 multiple payloads or multiple messages are exchanged between *Trading Partners*.

970
971 The *ebXML Messaging Service Layer* enforces the "rules of engagement" as defined by
972 two *Trading Partners* in a *Collaboration Protocol Agreement* (including, but not limited
973 to security and *Business Process* functions related to message delivery). The
974 *Collaboration Protocol Agreement* defines the acceptable behavior by which each *Party*
975 agrees to abide. The definition of these ground rules can take many forms including
976 formal *Collaboration Protocol Agreements*, interactive agreements established at the time
977 a business transaction occurs (e.g. buying a book online), or other forms of agreement.
978 There are *Messaging Service Layer* functions that enforce these ground rules. Any
979 violation of the ground rules result in an error condition, which is reported using the
980 appropriate means.

981
982 The *ebXML Messaging Service* performs all security related functions including:

- 983 • Identification
- 984 • Authentication (verification of identity)
- 985 • Authorization (access controls)
- 986 • Privacy (encryption)
- 987 • Integrity (message signing)
- 988 • Non-repudiation
- 989 • Logging

990 **8.5.3 Interfaces**

991
992 The *ebXML Message Service* provides ebXML with an abstract interface whose
993 functions, at an abstract level, include:

- 994
995 • Send – send an *ebXML Message* – values for the parameters are derived from the
996 *ebXML Message Headers*.
- 997 • Receive – indicates willingness to receive an *ebXML Message*.
- 998 • Notify – provides notification of expected and unexpected events.

- 999 • Inquire – provides a method of querying the status of the particular ebXML
1000 Message interchange.

1001
1002 The *ebXML Messaging Service* SHALL interface with internal systems including:

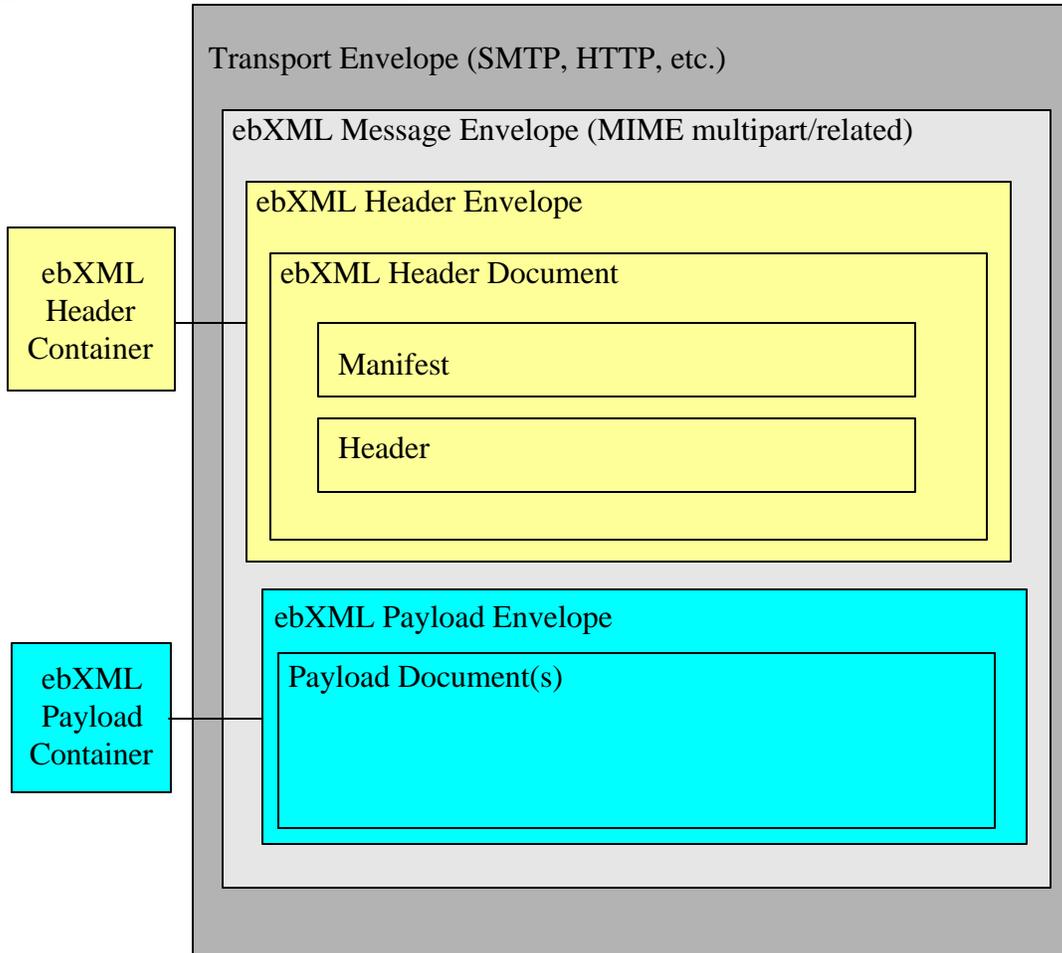

- 1003 • Routing of received messages to internal systems
- 1004 • Error notification

1005
1006 The *ebXML Messaging Service* SHALL help facilitate the interface to an ebXML
1007 Registry.

1008
1009 **8.5.4 Non-Normative Implementation Details**

1010
1011 **ebXML Message Structure and Packaging**

1012
1013 Figure 17 below illustrates the logical structure of an *ebXML Message*.

1014
1015
1016
1017

Figure 17 - ebXML Message Structure

1018 An *ebXML Message* consists of an optional transport *Protocol* specific outer
1019 *Communication Protocol Envelope* and a *Protocol* independent *ebXML Message*
1020 *Envelope*. The *ebXML Message Envelope* is packaged using the MIME multipart/related
1021 content type. MIME is used as a packaging solution because of the diverse nature of
1022 information exchanged between *Partners* in *eBusiness* environments. For example, a
1023 complex *B2B business transaction* between two or more *Trading Partners* might require
1024 a payload that contains an array of business documents (*XML* or other document
1025 formats), binary images, or other related Business Information.

1026 **9 Conformance**

1027

1028 **9.1 Introduction**

1029

1030 This clause specifies the general framework, concepts and criteria for *Conformance* to
1031 ebXML, including an overview of the conformance strategy for ebXML, guidance for
1032 addressing conformance in each ebXML technical specification, and the conformance
1033 clause specific to the Technical Architecture specification. Except for the Technical
1034 Architecture Specification, this clause does not define the conformance requirements for
1035 each of the ebXML technical specifications – the latter is the purview of the technical
1036 specifications.

1037

1038 The objectives of this section are to:

- 1039 a) Ensure a common understanding of conformance and what is required to claim
1040 conformance to this family of specifications;
- 1041 b) Ensure that conformance is consistently addressed in each of the component
1042 specifications;
- 1043 c) Promote interoperability and open interchange of *Business Processes* and
1044 messages;
- 1045 d) Encourage the use of applicable conformance test suites as well as promote
1046 uniformity in the development of conformance test suites.

1047

1048 Conformance to ebXML is defined in terms of conformance to the ebXML infrastructure
1049 and conformance to each of the technical specifications for ebXML. The primary
1050 purpose of conformance to ebXML is to increase the probability of successful
1051 interoperability between implementations and the open interchange of XML business
1052 documents and messages. Successful interoperability and open interchange is more
1053 likely to be achieved if implementations conform to the requirements in the ebXML
1054 specifications.

1055

1056 **9.2 Conformance to ebXML**

1057

1058 ebXML Conformance is defined as conformance to an ebXML system that is comprised
1059 of all the architectural components of the ebXML infrastructure and satisfies at least the
1060 minimum conformance requirements for each of the ebXML technical specifications,

1061 including the functional and interface requirements in this Technical Architecture
1062 specification.

1063

1064 In the context of ebXML, an implementation is said to exhibit conformance if it complies
1065 with the requirements of each applicable ebXML technical specification. The
1066 conformance requirements are stated in the conformance clause of each technical
1067 specification of ebXML. The conformance clause specifies explicitly all the
1068 requirements that have to be satisfied to claim conformance to that specification. These
1069 requirements MAY be applied and grouped at varying levels within each specification.

1070

1071 **9.3 Conformance to the Technical Architecture Specification**

1072

1073 This section details the conformance requirements for claiming conformance to the
1074 Technical Architecture specification.

1075

1076 In order to conform to this specification, each ebXML technical specification:

1077

a) SHALL support all the functional and interface requirements defined in this
specification that are applicable to that technical specification;

1078

1079 b) SHALL NOT specify any requirements that would contradict or cause non-
1080 conformance to ebXML or any of its components;

1081

c) MAY contain a conformance clause that adds requirements that are more specific
and limited in scope than the requirements in this specification;

1082

d) SHALL only contain requirements that are testable.

1083

1084
1085 A conforming implementation SHALL satisfy the conformance requirements of the
1086 applicable parts of this specification and the appropriate technical specification(s).

1087

1088 **9.4 General Framework of Conformance Testing**

1089

1090 The objective of conformance testing is to determine whether an implementation being
1091 tested conforms to the requirements stated in the relative ebXML specification.

1092

1093 Conformance testing enables vendors to implement compatible and interoperable systems
1094 built on the ebXML foundations. ebXML *implementations* and *Applications* SHOULD be
1095 tested to available test suites to verify their conformance to ebXML Specifications as
1096 soon as test suites are available.

1096

1097 Publicly available test suites from vendor neutral organizations such as OASIS and NIST
1098 SHOULD be used to verify the conformance of ebXML *Implementations*, *Applications*,
1099 and *Components* claiming conformance to ebXML. Open source reference
1100 implementations MAY be available to allow vendors to test their products for interface
1101 compatibility, conformance, and interoperability.

1102

1103 **10.0 Security Considerations**

1104

1105 **10.1 Introduction**

1106 A comprehensive *Security Model* for ebXML will be expressed in a separate document.
1107 The *Security Model* will be applied to the entire *ebXML Infrastructure*, with the
1108 underlying goal of best meeting the needs of users of ebXML.

1109
1110 The Security Model will comply with security needs specified in the *ebXML*
1111 *Requirements Document*.

1112

1113 **Disclaimer**

1114 The views and specification expressed in this document are those of the authors and are
1115 not necessarily those of their employers. The authors and their employers specifically
1116 disclaim responsibility for any problems arising from correct or incorrect implementation
1117 or use of this design.

1118 **Copyright Statement**

1119 Copyright © ebXML 2000. All Rights Reserved.

1120

1121 This document and translations of it MAY be copied and furnished to others, and
1122 derivative works that comment on or otherwise explain it or assist in its implementation
1123 MAY be prepared, copied, published and distributed, in whole or in part, without
1124 restriction of any kind, provided that the above copyright notice and this paragraph are
1125 included on all such copies and derivative works. However, this document itself MAY
1126 not be modified in any way, such as by removing the copyright notice or references to the
1127 Internet Society or other Internet organizations, except as needed for the purpose of
1128 developing Internet standards in which case the procedures for copyrights defined in the
1129 Internet Standards process must be followed, or as REQUIRED to translate it into
1130 languages other than English.

1137 IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE
1138 USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY RIGHTS OR
1139 ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A
1140 PARTICULAR PURPOSE.

1141

1141 **Appendix A: Example ebXML Business Scenarios**

1142 **Definition**

1143 This set of scenarios defines how ebXML compliant software could be used to implement
1144 popular, well-known *eBusiness* models.

1145 **Scope**

1146 These scenarios are oriented to properly position the *ebXML Framework Specifications*
1147 as a convenient mean for companies to properly run electronic business over the Internet
1148 using open standards. They bridge the specifications to real life uses.

1149 **Audience**

1150 Companies planning to use ebXML compliant software will benefit from these scenarios
1151 because they will show how these companies may be able to implement popular business
1152 scenarios onto the ebXML specifications.

1153 **List**

- 1154 a) Two *Trading Partners* set-up an agreement and run the associated electronic
1155 exchange.
- 1156 b) Three or more *Trading Partners* set-up a *Business Process* implementing a
1157 supply-chain and run the associated exchanges
- 1158 c) A Company sets up a Portal that defines a *Business Process* involving the use of
1159 external business services.
- 1160 d) Three or more *Trading Partners* engage in multi-*Trading Partner Business*
1161 *Process* and run the associated exchanges.

1162 **Scenario 1 : Two Trading Partners set-up an agreement and run** 1163 **the associated exchange**

1164 In this scenario:

- 1165 • Each *Trading Partner* defines its own Profile (CPP).
1166 Each Profile references:
 - 1167 ○ One or more existing *Business Process* found in the ebXML Repository
 - 1168 ○ One of more Message Definitions. Each Message definition is built from
1169 reusable components (*Core Components*) found in the ebXML Repository
 Each Profile (CPP) defines:
 - 1170 ○ The Commercial Transactions that the *Trading Partner* is able to engage into
 - 1171 ○ The Technical protocol (like HTTP, SMTP etc) and the technical properties
1172 (such as special encryption, validation, authentication) that the *Trading*
1173 *Partner* supports in the engagement
 - 1174 ○ The *Trading Partners* acknowledge each other profile and create an
1175 Agreement (CPA).
1176
- 1177 • The *Trading Partners* implement the respective part of the Profile. This is done:
 - 1178 ○ Either by creating/configuring a *Business Service Interface*.
 - 1179 ○ Or properly upgrading the legacy software running at their side
 In both cases, this step is about :
 - 1180 ○ Plugging the Legacy into the ebXML technical infrastructure as specified by
1181 the *Messaging Service*.
 - 1182 ○ Granting that the software is able to properly engage the stated conversations
1183

- 1184 ○ Granting that the exchanges semantically conform to the agreed upon
- 1185 Message Definitions
- 1186 ○ Granting that the exchanges technically conform with the underlying ebXML
- 1187 *Messaging Service*.
- 1188 • The *Trading Partners* start exchanging messages and performing the agreed upon
- 1189 commercial transactions.
- 1190

1191 **Scenario 2: Three or more parties set-up a Business Process**
 1192 **implementing a supply-chain and run the associated exchanges**

1193 The simple case of a supply-chain involving two *Trading Partners* can be redefined in
 1194 terms of the Scenario 1.

1195
 1196 Here we are dealing with situations where more *Trading Partners* are involved. We
 1197 consider a supply chain of the following type:

1202
 1203
 1204 What fundamentally differs from Scenario 1 is that “*Trading Partner 2*” is engaged at the
 1205 same time with two different *Trading Partners*. The assumption is that the “state” of the
 1206 entire *Business Process* is managed by each *Trading Partner*, i.e. that each *Trading*
 1207 *Partner* is fully responsible of the Commercial Transaction involving it (“*Trading*
 1208 *Partner 3*” only knows about “*Trading Partner 2*”, “*Trading Partner 2*” knows about
 1209 “*Trading Partner 3*” and “*Trading Partner 1*”, “*Trading Partner 1*” knows about
 1210 “*Trading Partner 2*”).

1211
 1212 In this scenario:

- 1213 • Each *Trading Partner* defines its own Profile (CPP). Each Profile (CPP)
- 1214 references:
 - 1215 ○ One or more existing *Business Process* found in the ebXML Registry
 - 1216 ○ One of more Message Definitions. Each Message definition is built from
 - 1217 reusable components (*Core Components*) found in the ebXML Registry
- 1218 Each Profile (CPP) defines:
 - 1219 ○ The Commercial Transactions that the *Trading Partner* is able to engage into.
 - 1220 “*Trading Partner 2*” must be able to support at least 2 Commercial
 - 1221 Transactions.
 - 1222 ○ The Technical protocol (like HTTP, SMTP etc) and the technical properties
 - 1223 (such as special encryption, validation, authentication) that the *Trading*
 - 1224 *Partner* supports in the engagement. As to “*Trading Partner 2*”, the technical
 - 1225 requirements for the exchanges with “*Trading Partner 1*” and “*Trading*
 - 1226 *Partner 3*” may be different. In such case, “*Trading Partner 2*” must be able
 - 1227 to support different protocols and/or properties.

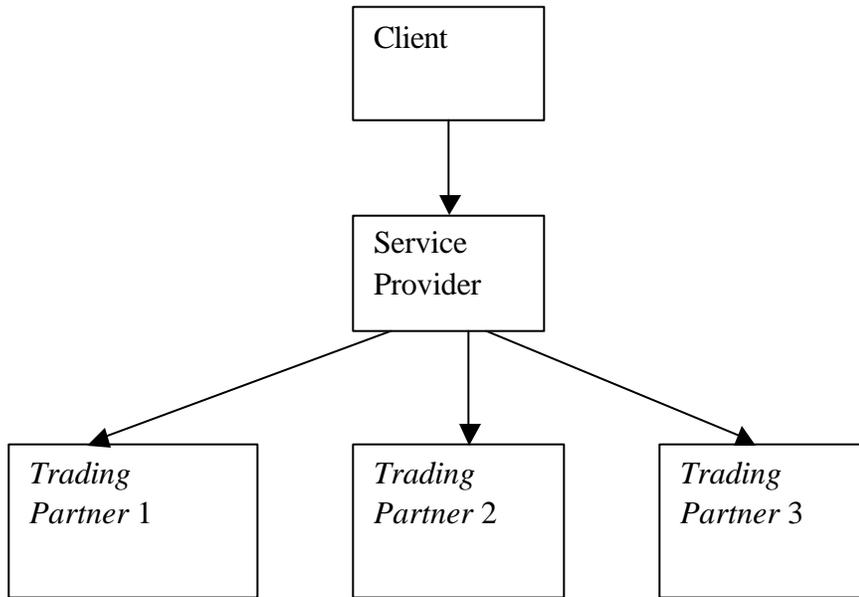

- 1228 ○ The *Trading Partners* acknowledge each other profile and create the relevant
- 1229 Agreements (CPA) (at least 2 in this Scenario).
- 1230 ○ “*Trading Partner 2*” is engaged in 2 Agreements (CPA).
- 1231 ● The *Trading Partners* implement the respective part of the Profile. This is done:
- 1232 ○ Either by creating/configuring a Business Service Interface.
- 1233 ○ Or properly upgrading the legacy software running at their side.
- 1234 In both cases, this step is about :
- 1235 ○ Plugging the Legacy into the ebXML technical infrastructure as specified by
- 1236 the *Messaging Service*
- 1237 ○ Granting that the software is able to properly engage the stated conversations
- 1238 ○ Granting that the exchanges semantically conform to the agreed upon
- 1239 Message Definitions
- 1240 ○ Granting that the exchanges technically conform with the underlying ebXML
- 1241 *Messaging Service*.
- 1242 ○ “*Trading Partner 2*” may need to implement a complex Business Service
- 1243 Interface in order to be able to engage with different *Trading Partners*.
- 1244 ● The *Trading Partners* start exchanging messages and performing the agreed upon
- 1245 commercial transactions.
- 1246 ○ “*Trading Partner 3*” places an order at “*Trading Partner 2*”
- 1247 ○ “*Trading Partner 2*” (eventually) places an order with “*Trading Partner 1*”
- 1248 ○ “*Trading Partner 1*” fulfills the order
- 1249 ○ “*Trading Partner 2*” fulfill the order
- 1250

1251 **Scenario 3 : A Company sets up a Portal which defines a**
 1252 **Business Process involving the use of external business**
 1253 **services**

1254 This is the Scenario describing a Service Provider. A “client” asks the Service Provider
 1255 for a Service. The Service Provider fulfills the request by properly managing the
 1256 exchanges with other *Trading Partners* that provide information to build the final answer.
 1257

1257
 1258
 1259
 1260
 1261
 1262
 1263
 1264
 1265
 1266
 1267
 1268
 1269
 1270
 1271
 1272
 1273
 1274
 1275
 1276
 1277
 1278

In the simplest case, this Scenario could be modeled as follows :

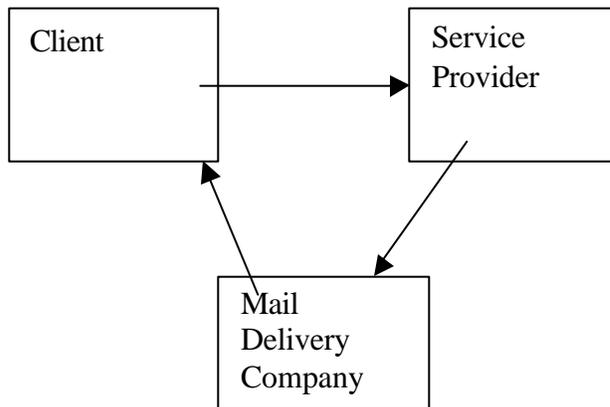

This is an evolution of Scenario 2. The Description of this scenario is omitted.

1279 **Scenario 4 : Three or more Trading Partners engage in multi-**
 1280 **Trading Partner Business Process and run the associated**
 1281 **exchanges**

1282 This Scenario is about 3 or more *Trading Partners* having complex relationships. An
 1283 example of this is the use of an external delivery service for delivering goods.

1284
 1285
 1286
 1287
 1288
 1289
 1290
 1291
 1292
 1293
 1294
 1295
 1296
 1297

1298 In this Scenario, each *Trading Partner* is involved with more than one other *Trading*
 1299 *Partner* but the relationship is not linear. The good which is ordered by the Client with
 1300 the Service Provider is delivered by a 3rd party.

1301 In this scenario:

- 1302 • Each *Trading Partner* defines its own Profile (CPP). Each Profile (CPP)
1303 references:
- 1304 ○ One or more existing *Business Process* found in the ebXML Repository
1305 ○ One of more Message Definitions. Each Message definition is built from
1306 reusable components (*Core Components*) found in the ebXML Repository
- 1307 Each Profile (CPP) defines:
- 1308 ○ The Commercial Transactions that the *Trading Partner* is able to engage into.
1309 In this case, each *Trading Partner* must be able to support at least 2
1310 Commercial Transactions.
- 1311 ○ The Technical protocol (like HTTP, SMTP etc) and the technical properties
1312 (such as special encryption, validation, authentication) that the *Trading*
1313 *Partner* supports in the engagement.
- 1314 In case the technical infrastructure underlying the different exchanges differs,
1315 each *Trading Partner* must be able to support different protocols and/or
1316 properties. (an example is that the order is done through a Web Site and the
1317 delivery is under the form of an eMail).
- 1318 ○ The *Trading Partners* acknowledge each other profile and create an
1319 Agreement (CPA). Each *Trading Partner*, in this Scenario, must be able to
1320 negotiate at least 2 Agreements.
- 1321 Each *Trading Partner* is engaged in 2 Agreements (CPA).
- 1322 • The *Trading Partners* implement the respective part of the Profile. This is done:
1323 ○ Either by creating/configuring a Business Service Interface.
1324 ○ Or properly upgrading the legacy software running at their side
- 1325 In both cases, this step is about :
- 1326 ○ Plugging the Legacy into the ebXML technical infrastructure as specified by
1327 the *Messaging Service*.
- 1328 ○ Granting that the software is able to properly engage the stated conversations
1329 ○ Granting that the exchanges semantically conform to the agreed upon
1330 Message Definitions
- 1331 ○ Granting that the exchanges technical conform with the underlying ebXML
1332 *Messaging Service*
- 1333 ○ All *Trading Partners* may need to implement complex Business Service
1334 Interfaces to accommodate the differences in the Agreements (CPA) with
1335 different *Trading Partners*.
- 1336 • The *Trading Partners* start exchanging messages and performing the agreed upon
1337 commercial transactions.
- 1338 ○ The Client places an Order at the Service Provider
1339 ○ The Service Provider Acknowledges the Order with The Client
1340 ○ The Service Provider informs the Mail Delivery Service about a good to be
1341 delivered at the Client
- 1342 ○ The Mail Delivery Service delivers the good at the Client
1343 ○ The Clients notifies the Service Provider that the good is received.
